1. what is Form

Form is an element that allows users to submit data to a web server. It's often used to collect user input, such as login details, registration info, search queries, or any other kind of information that can be processed or saved on a server.

2. <input>

It is used to collect user input. For example when you want users to provide their name, email, password, or any other type of information, you ~~see~~ use the <input> field

3 select & option

select : It is used to create a dropdown menu or a list of options ~~from~~ which the user can choose

option : The <option> element defines the individual options inside a <select> dropdown

Each <option> is a choice

4. Use of value

* Form submission : The value attribute holds the data that will be sent to the server
* Default values
* Pre-selected options
